IOPS course Statistical Learning and Prediction

Dates   February 1 & 2, 2022 (10-18h, Leiden)

Description
Statistical learning refers to a vast set of tools for understanding data. Two classes of such tools can be distinguished: "supervised" and "unsupervised". Supervised statistical learning involves building a statistical model for predicting an output (response, dependent) variable based on one or more input (predictor) variables. There are many areas of psychology where such a predictive question is of interest. For example, finding early markers for Alzheimer's or other diseases, selection studies for personnel or education, or prediction of treatment outcomes. In unsupervised statistical learning, there are only input variables but no supervising output (dependent) variable; nevertheless we can learn relationships and structures from such data using cluster analysis and methods for dimension reduction. In this course we aim to give the student a firm theoretical basis for understanding and evaluating statistical learning techniques and teach the students skills to apply statistical learning techniques in empirical research. Techniques often referred to as 'machine learning' (though we prefer the name 'statistical learning', because the basic problems of sampling and probability have not changed with the newer algorithms) will be discussed, including: cross-validation, elastic net regression, clustering (k-means, hierarchical), partial least squares, k-nearest neighbours, decision trees, gradient boosting, random forests, smoothing splines and support vector machines.

Target group PhD candidates

Teachers: Marjolein Fokkema, Tom Wilderjans

Method   Lab sessions, in which lectures are combined with computer assignments.

Preparation   Students receive a list of online videos and associated parts and exercises of the book of James et. al, 2021 (see below) that should be prepared before the course starts. This will take about 20 – 25 hours, depending on current statistical knowledge and R skills.

Assessment method   Active participation

Registration secretariaat.iops@rug.nl   **Deadline: January 10, 2022**

Course fees IOPS members: free
Affiliated members: 400 Euros
